### Blurb

Climate change has become an agenda of key concern and requires our utmost attention. There are several factors that collectively attribute to climate change but anthropogenic activities since the early 1700s, could be considered the major cause. Climate change causes hindrances in the sustainable development of society which not only affects mankind but all the species existing in an ecosystem.

This book highlights the connection between climate change and sustainable development, exploring the impacts of climate change on the environment, economy, and society. It is a result of contributions from multiple authors, aimed at raising awareness and encouraging further research on the topic.
